What this project is about

This project makes thin-film growth visible and interactive. It explores how material settles onto a surface and why a layer that looks solid can still hide an empty pocket underneath. Users can experiment with different conditions and see how they change the finished film.

What are some key features

- **Adjustable recipes:** explore different growth conditions and surface shapes.
- **Visual growth and replay:** watch a film form and revisit earlier stages.
- **Film inspection:** examine the finished surface and its cross-section.
- **Recipe comparison:** compare your choices with a reference recipe.
- **Lot history:** review and compare earlier simulation runs.
